4.4/5 Free download movies1. Field of the Invention The present invention relates to a type of computer-based tax return preparation and electronic filing. More particularly, the present invention relates to a method of using a pre-existing computer, and providing a computer-based tax preparation and electronic filing service in such a manner that end users of the service can directly generate one or more electronic tax returns, with a built-in schedule of estimated tax payments, and without having to understand how to use a traditional tax preparation and filing process. 2. Background of the Invention The tax system of the United States is very complicated and requires the assistance of both a tax preparer and the Internal Revenue Service (IRS) to complete. The tax preparer provides expertise and guidance to the taxpayer in applying income tax regulations and forms, and prepares the taxpayer's tax returns and files them with the IRS. The taxpayer may also use one or more software products to complete their tax return. U.S. Pat. No. 4,812,904 describes a computer-based method for the preparation of income tax returns. More particularly, a method is described for use by the taxpayer in completing the income tax return forms by using a general purpose computer with word processing and mathematical computing capability. The method includes the steps of providing the taxpayer with a customized tax return form, providing the taxpayer with a statement of taxable income and deductions, storing the information on a magnetic disc in the computer, and using the computer to calculate the amounts of taxable income and deductions and complete the tax forms. This method requires that the taxpayer be proficient in the use of a general purpose computer, and the use of a specialized tax form, and it does not provide a means of estimating and paying the tax due. U.S. Pat. No. 5,394,402 discloses a method for preparing tax forms using a conventional personal computer. This method includes the steps of providing the user with a specialized form template and a database of information on a set of income sources, the income sources database being formatted in accordance with a predetermined format, executing a tax preparation program and using the template and information from the database, entering a tax amount and source of income, and printing out tax forms. A user can access the template from the computer using a graphical user interface. While this method provides for some ability to generate tax forms from information already stored in the database, it is limited in that the user cannot estimate their tax liability, and it requires the use 2d92ce491b
