The Ethereum-based investment fund is currently backed by 15 investors across the world and aims to support early-stage startups. Genesis was one of the first blockchain companies to support and use the Ethereum blockchain, which is used in numerous dapps for various industries. Jothi Raman, founder, Genesis, said: "We are excited to be a part of Blockchain Global as an early-stage investor and we have great confidence in the fund and the future of its startups." John Johnston, Global Head of Investments, Blockchain Global, added: "Genesis is a company we've admired for a while, and we're really happy to be backing such an innovative company." Generation The Genesis platform is a decentralized autonomous organization, built

A radar device includes a transmitter for transmitting an electromagnetic wave signal as a probe wave. The transmitter may have a structure in which a pulsed circuit including a diode and a capacitor for switching a drive voltage to be applied to the diode is connected to a signal output terminal of a power source and a driving signal is obtained from the pulsed circuit. In this structure, a pulsed voltage is output from the pulsed circuit in accordance with the drive voltage, and the pulsed voltage is applied to a probe coil mounted on a vehicle. As a result, the probe coil generates a probe wave in accordance with the pulsed voltage. In the above-described structure, when an external drive voltage is applied to the pulsed circuit, a drive current flows from the diode to the capacitor. Therefore, when a large current is continuously applied to the pulsed circuit, the drive voltage is saturated and a correct pulsed voltage cannot be obtained. To prevent the above-described problem, a method has been employed in which a drive voltage is pulsed only for a short time and a correct pulsed voltage is obtained (for example, refer to Japanese Unexamined Patent Application, Publication No. 2008-114787). However, even in the method described in Japanese Unexamined Patent Application, Publication No. 2008-114787, when an antenna of

the radar device is tilted, a directivity of a probe wave is changed. As a result, an angular resolution of the 2d92ce491b
